 [Basic problems of industrial hygiene in farming.] *Gigiena i Sanitariya*, No. 6:10-14, June
 1954. DLC—Most important problems of industrial hygiene in modern farming are: 1) pro-
 tection of human organism from unfavorable meteorological conditions (high and low tem-
 peratures, extreme insolation, high humidity) and 2) protection from dust and gases. In-
 vestigations of Kiev Institute show that tractor drivers and other operators of farm machinery
 have somewhat higher body temperature as a result of high air temperatures and high in-
 solation. Kiev Institute constructed special umbrella and driver's cabin (double-walled with
 thermo-insulating floors and front wall) to protect the driver from radiation effects. *Subject*

"Experimental Data on the Reflex Mechanism of the Action of Mercuric and Organophosphorus Insectofungicides," by L. I. Medved', Yu. S. Kagan, and Ye. I. Spynu, VIII Vsesoyuznyy S'yezd Fiziologov, Biokhimikov, Farmakolov (VIII All-Union Session of Physiologists, Biochemists, and Pharmacologists) Moscow, 1955, 408-410 (from Sovetskoye Meditsinskoye Referativnoye Obozreniye, Normal'naya i Patologicheskaya Fiziologiya, Biokhimiya, Farmakologiya i Toksikologiya, No 27, 1956, abstract by F. Meyerson, pp 126-127)

"Experiments in which the conditioned reflex method was utilized established that the administration of toxic doses of thiophos and carbophos to animals produced an inhibitory reaction of the higher branches of the nervous system marked by a prolongation of the latent period of conditioned reflexes and the time necessary for their transmission, phase manifestations, their extinction, an absence of the natural conditioned reflex to food, and a diminution of the orientation reflex. These disturbances, which are reversible in character, may be regarded as being in the nature of a protective-defensive inhibition. This is confirmed by the positive results which are obtained with the use of soporific substances in the therapy of intoxications in animals by thiophos.

SUM-1374

NEED, L. I.

"The inhibition of the activity of cholinesterase and the accumulation of acetylcholine play an important role in the mechanism of the toxic action of organophosphorus compounds. The changes which take place in conditioned reflex activity and in the activity of the serum cholinesterase are parallel and form the early symptoms of intoxication. The authors concluded that the mercuric and organophosphorus compounds, being enzymic poisons with selective action on the thiol enzymes and cholinesterase, respectively, even in small doses cause changes in the functional condition of the nervous system. In a number of cases it was possible to establish a definite dependence of the changes in the nervous system on the degree of depression of the enzymic systems. (U)

AUTHOR: Medved, L. I. (professor)

TITLE: Toxicological and hygienic characterization of modern pesticides

SOURCE: Vsesoyuznoye khimicheskoye obshchestvo. Zhurnal, v. 9, no. 5, 1964, 561-566

TOPIC TAGS: pesticide, toxicology

Abstract: Pesticides, as biologically active substances, possess varying degrees of toxicity with respect to warm-blooded animals and man, and can be classed in four groups: 1) strong-action substances -- LD₅₀ for animals less than 50 mg/kg of weight of the animal; 2) highly toxic -- LD₅₀ 50-200 mg/kg; 3) medium toxic -- LD₅₀ 200-1000 mg/kg; 4) relatively nontoxic -- LD₅₀ greater than 1000 mg/kg. In determining the potential danger of a preparation, one considers the toxic effect after respiratory and skin penetration, the value of the dose of toxic action (difference between the threshold and lethal doses) cumulative properties, physico-chemical (volatility, solubility, stability under natural conditions, etc.) and other properties, as well as

Card 1/2

L 3208-66

ACCESSION NR: AP5015114

the species sensitivity of the animals to individual preparations. Toxicological characterizations are given for organochlorine pesticides, bicyclic preparations of the diene group, dinitrophenol pesticides, mercury compounds, chloro-derivatives of phenoxyacetic acid, compounds of arsenic and other heavy metals, and others, relating the structure of the compound to the biochemical mechanism of its action.

TITLE: Effect of gas sorption upon the electroconductivity and coefficient of light reflection of cadmium selenide films

SOURCE: Mezhvuzovskaya nauchno-tekhnicheskaya konferentsiya po fizike poluprovodnikov (poverkhnostnyye i kontaktnyye yavleniya). Tomsk, 1962.

Poverkhnostnyye i kontaktnyye yavleniya v poluprovodnikakh (Surface and contact phenomena in semiconductors). Tomsk, Izd-vo Tomskogo univ., 1964, 372-379

TOPIC TAGS: sorption, electroconductivity, light reflection coefficient, cadmium selenide, oxygen, nitrogen, hydrogen

ABSTRACT: Electroconductivity of polycrystalline films of cadmium selenide was studied in vacuum and in oxygen, nitrogen, hydrogen, and air atmospheres. This is a summary and an extension of previous publications by the authors in which the effect of the above gases upon the electroconductivity, light sensitivity, and coefficient of light reflection was discussed. It is stated that the

Card 1/3

L 2671-66

ACCESSION NR: AT5020483

coefficient of reflection depends largely upon the gaseous medium which causes the greatest changes in the electroconductivity. Specimens were prepared by evaporative deposition of CdSe in vacuum on glass with attached electrodes. The setup and the method of measurement were described earlier by Yu. K. Vishchakas and A. Madayahis (Uch. zap. Vil'nyuskogo gosuniv., 33, 161, 1960). The measurements were taken without removing the specimen from the vacuum. The contact potential differential was measured by means of a vibrating condenser which also served for measuring electroconductivity. The coefficient of the light reflection was measured with a polarizing goniometer. All the measurements were performed at room temperature. It was found that electroconductivity of the films, prepared at 10^{-6} mm Hg is comparatively large ($1 \text{ ohm}^{-1} \text{ cm}^{-1}$), but is considerably smaller ($10^{-6} \text{ ohm}^{-1} \text{ cm}^{-1}$) for those prepared at 10^{-3} mm Hg. Among the gases studied the greatest effect was obtained with O_2 , which considerably decreased the conductivity, while nitrogen had no effect. The ratio of electroconductivity in vacuum to that in air varies inversely with the thickness of the film and depends upon the pressure at which the specimen was prepared. The work function was found to increase concurrently with decreased electroconductivity in dry air and oxygen. Angular function of the light reflection coefficient in vacuum and in air was studied in polarized light, but the values obtained for the changes in the reflection coefficient could not be correlated with those of skin conductivity. Further experiments should

Card 2/3

L. 2671-66

ACCESSION NR: AT5020483

3

be conducted in this field, taking in account volume conductivity as well as the presence of a transition layer. It is assumed that the variations of quasi-skin conductivity are the most important factor in changes occurring in the coefficient of light reflection. Orig. art. has: 4 figures, 1 table, and 7 formulas.

CONT.

Respiratory disturbance of cor pulmonale Z. KREISI-FORSCH.
1956, 45/21-22 (834-839) Tables I

In most cases of cor pulmonale there is no orthopnoea in spite of very severe cardiac and respiratory insufficiency. Increase of the vital capacity when changing from the horizontal to the vertical position is also rarely observed in this group of patients, in contrast to normal persons, emphysematous patients and patients with pulmonary and heart failure. This phenomenon may be attributed to the contraction of pulmonary arterioles giving rise to the pulmonary hypertension in cor pulmonale. This contraction protects the capillary region from overfilling due to clivostatic increase of the venous return flow.

"Auricular Fibrillation After Laparoscopy."

Budapest, Orvosi Hetilap, Vol 104, No 38, 22 Sep 63, pages 1801-1802.

Abstract: [Authors' Hungarian summary] The authors describe a case of
laparoscopy. After the completion of the procedure, abdominal complaints
(cramp, nausea, vomiting) and auricular fibrillation arose. The latter was
caused by viscerovisceral reflexes and ceased when the abdominal complaints
subsided. 1 Hungarian, 9 Western references.
